

## NAGRA VI SERVICE BULLETIN FOR THE VERSION 3.00

*(Installation of this version WILL erase all the settings and internal templates of your machine, and some previously saved templates made with version 2.xx may not be complete when using version 3.00)*

*This is a list of the improvements and new features in the version 3.00 for the NAGRA-VI detailed explanations of all the new features and printed examples of the different menus, screens, templates and directory report are all covered in the new manual dated July 2010 available on our web site.*

- **New:** The channel count moves from 6 to 8. The internal mix is attributed to channels 7 + 8. Channels 5 + 6 have a mute position in the drop-down menu depending on the use of inputs 5 & 6 (AES). Monitoring of channels 7 & 8 can be selected in the monitoring menu by selecting the "7+8 if mon. OFF" position and then setting all the monitoring selectors on the front panel to the OFF position.
- **New:** The mixer is now ALWAYS 6 channels. Mono selection is now made in the mixer menu by selecting MONO under the output level fader. This mode allows 6 to 1 mixing.
- **New:** Optimization of the formatting time for hard disks. This is particularly useful for external USB hard drives. (An external 500GB disk will now format in 20 seconds rather than the 20 minutes previously needed)
- **New:** A Playback screen selection has been added to the screen templates menu allowing the user to select the screen display mode during playback.
- The TC Out and display in STOP mode has been improved. Previously there was a 2 – 3 frame difference due to the dynamic compensation.
